

## ABSTRACT

The image pickup device of the present invention is capable of photographing still images during photography of a moving image, and is provided with a notifying means for visually notifying a subject that a photographic operation of a still image is to be performed when a release button 23 is pressed half-way down during photography of the moving image, and then performs the photographic operation when the release button 23 is fully pressed. The first notifying means may be a light emitting means 25 which lights up or flashes when the release button 23 is pressed half-way down, or maybe a flash lamp device in which a light source 27 pops up when the release button 23 is pressed half-way down.
